MECHANICS

Presented by:

Dr. Bhanudas Narwade

DEPT. OF PHYSICS

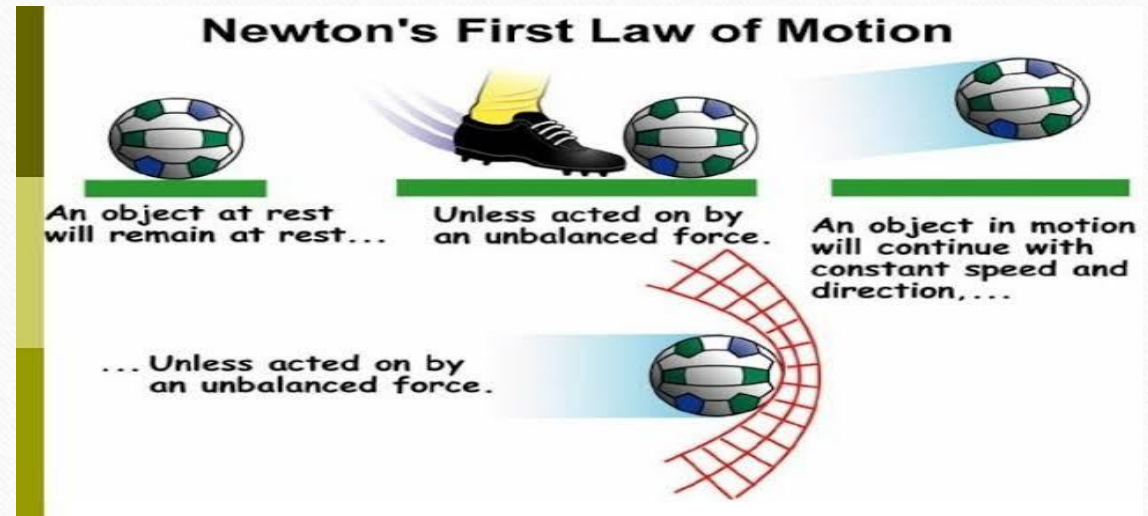

DEGLOOR COLLEGE, DEGLOOR

Basic: Mechanics:

- **Mass:** The amount of matter that body contains
- **Force:** The external agency that changes or tends to change the state of rest or uniform motion of body
- **Inertia:** Inability of material body to change by itself its state of rest or uniform motion
- **Work done:** product of force and displacement in the direction of force
- **Energy:** S Capacity to do work.

Newton's laws of motion:

- **Newton's First law of motion:** Every body in this universe, continuous to be in a state of rest or uniform motion in a straight line, unless it is compelled to change that state by forces impressed on it.
- Also called law of inertia
- Gives definition of force

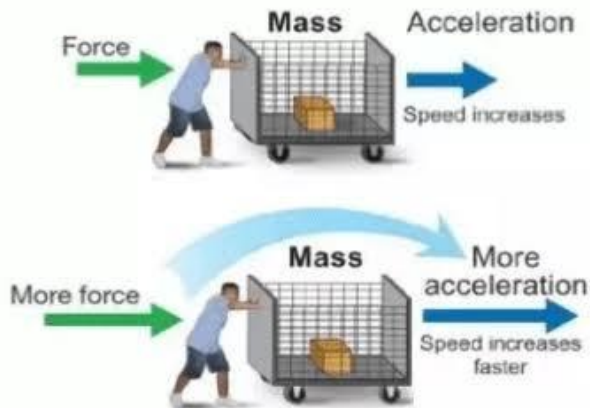

Newton's second law of motion:

- **STATEMENT:** The rate of change of momentum of a body is directly proportional to impressed force and takes place in the direction of force
- Gives measure of force

Newton's Second Law

If you apply more force to an object, it accelerates at a higher rate.

To get the wagon to accelerate, you have to apply a PULL (Force).

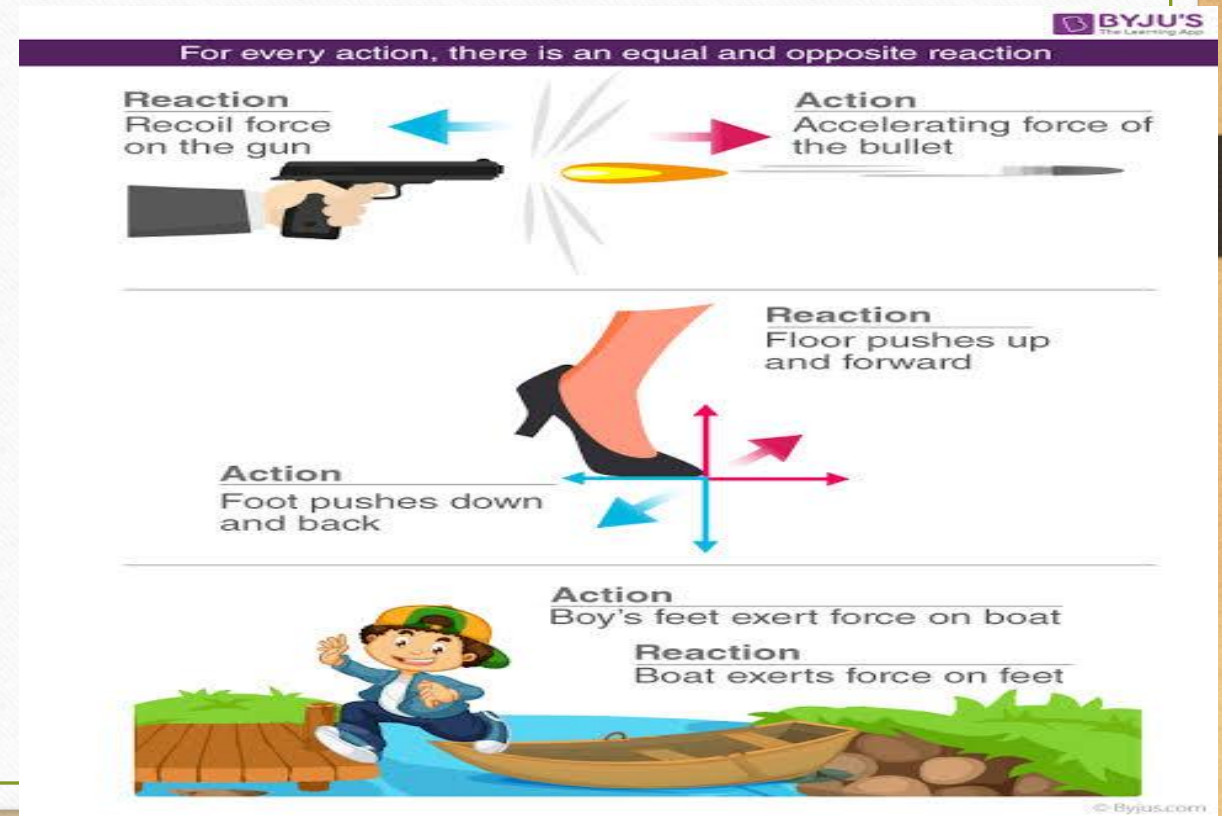

If the MASS of the wagon increases, a greater PULL is necessary to accelerate it.

Newton's third law of motion:

- **STATEMENT:** To an every action there is always an equal and opposite reaction
- Specifies the property of force

NEWTON'S LAW OF GRAVITY:

- **STATEMENT:** Every particle of matter in the universe attract every other particle of matter with a force which is directly proportional to product of their masses and inversely proportional to square of distance between them

$$F \propto m_1 m_2$$

$$F \propto \frac{1}{r^2}$$

$$F \propto \frac{m_1 m_2}{r^2}$$

$$F = G \frac{m_1 m_2}{r^2}$$

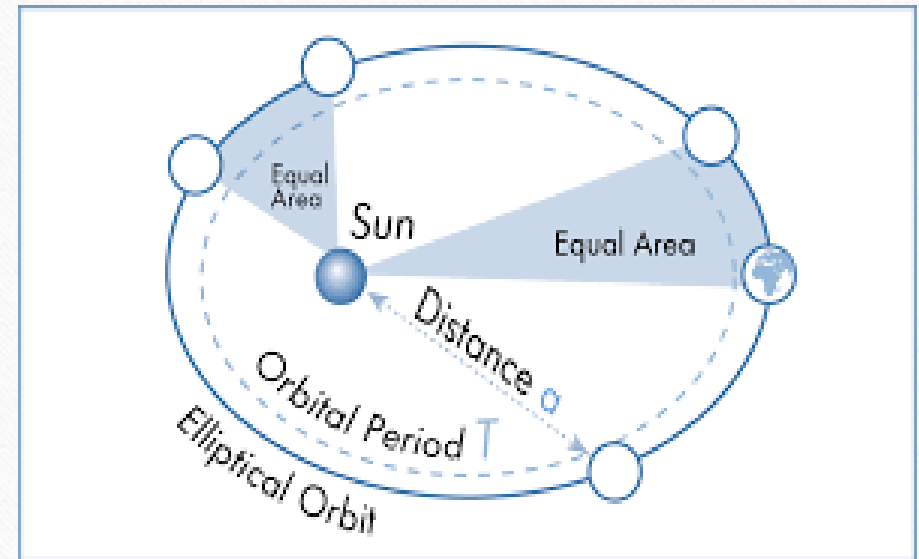

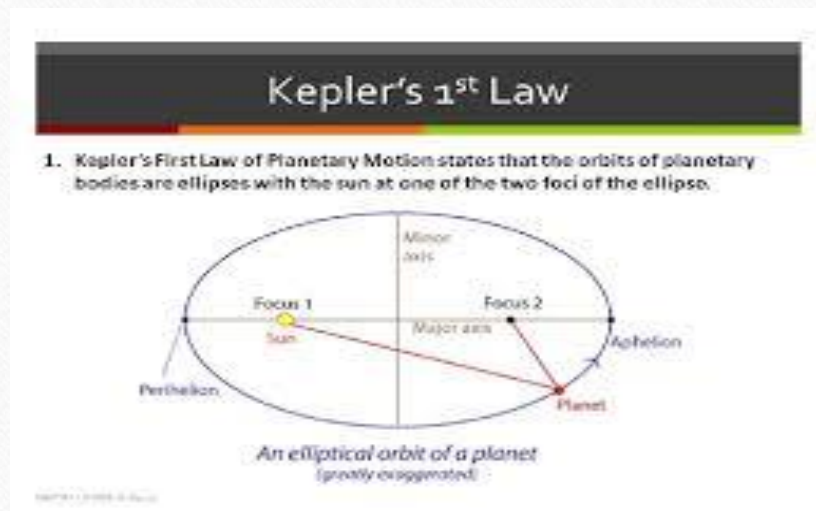

Newton's Law of Universal Gravitation

$$F_1 = F_2 = G \frac{m_1 \times m_2}{r^2}$$

KEPLER'S LAWS OF PLANETARY MOTION:

- **Kepler's First Law of planetary motion (Law of orbit):**
 - **STATEMENT:** Every planet revolves around the Sun in an elliptical orbit where sun is situated at one of foci of ellipse.
-

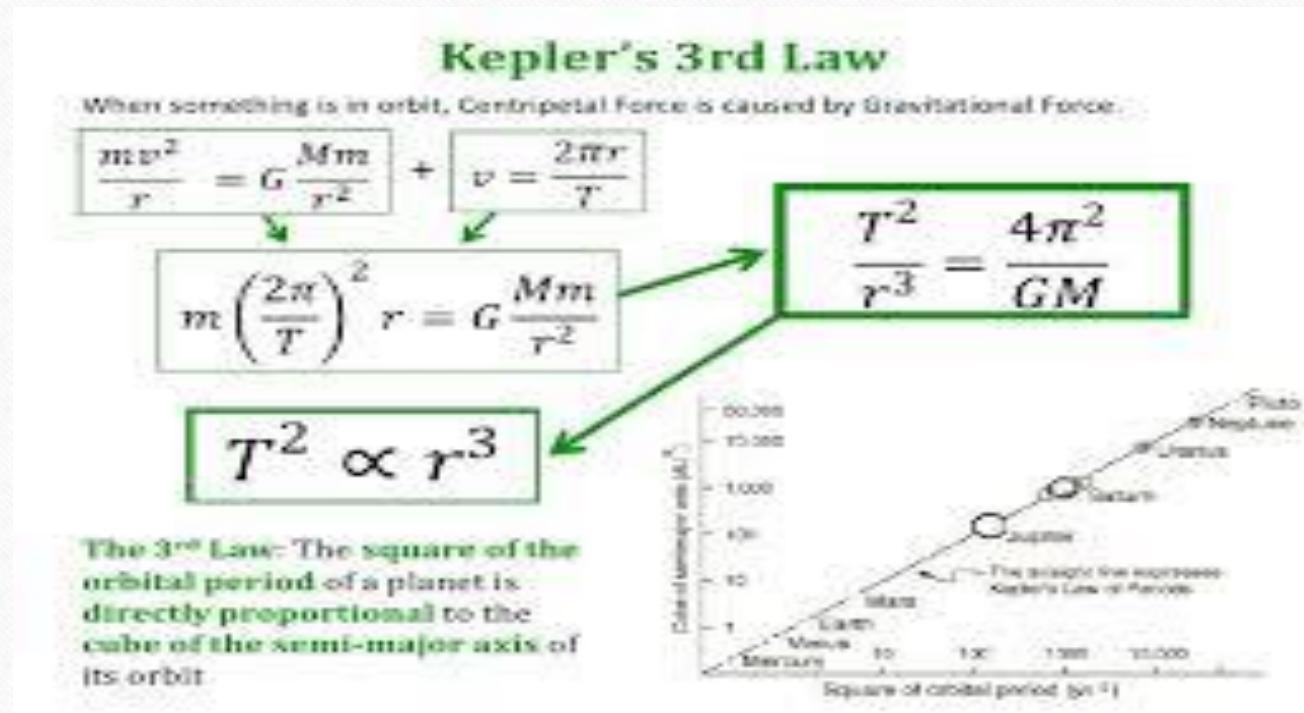

KEPLER'S LAWS OF PLANETARY MOTION:

- Kepler's Second law of Motion (Law of equal areas):
- **STATEMENT** :Line joining sun and planet sweeps out equal areas in equal interval of time i.e. Areal velocity of planet is constant.

KEPLER'S LAWS OF PLANETARY MOTION:

- Kepler's Third law of Motion (Harmonic Law):
- **STATEMENT** : The square of period of revolution of planet around the sun is directly proportional to cube of semi-major axis of ellipse

GRAVITATIONAL FIELD AND INTENSITY:

- Space around a body, within which its gravitational attraction is experienced
- Intensity at a point is force experienced by unit mass placed in a field.
- OR Rate of change of gravitational potential

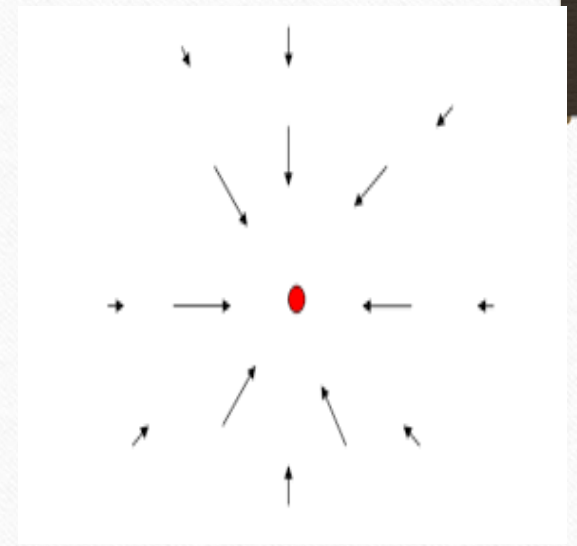

- If gravitational field at a point is E , the force acting on a mass m is

- $F = m E$

- $E = F/m$

Also the gravitational field is the negative gradient of

gravitational potential $E = -\frac{dV}{dx}$

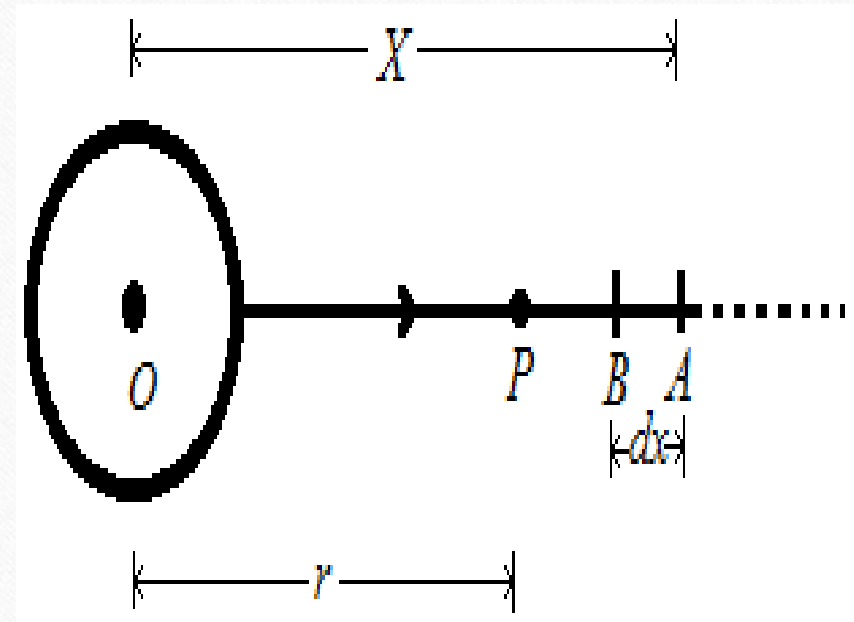

GRAVITATIONAL POTENTIAL:

- Amount of work done in moving unit mass from the point to infinity against the gravitational force of attraction.
 - Measure of energy in a field at a point compared to infinite distance away
-

- Zero of potential at infinity
- Consider body of mass m .
- P is point at a distance r
- The gravitational intensity at P

$$E = \frac{F}{m} = \frac{GM}{r^2}$$

- Scalar quantity

GRAVITATIONAL POTENTIAL AT A POINT:

- $E = -\frac{dV}{dr}$
- $dV = \left(\frac{-GM}{r^2}\right) dr$

- Integrating between limits infinity and r,
- $\int dV = \int_r^\infty \left(\frac{-GM}{r^2}\right) dr = \left[\frac{GM}{r}\right] = \left[\frac{GM}{\infty} - \frac{GM}{r}\right]$
- $V = -\frac{GM}{r}$
- The gravitational potential at a point due to a point mass
- $V = -\frac{GM}{r}$

GRAVITATIONAL POTENTIAL ENERGY:

- Gravitational potential energy at a point is the work done to move a mass from infinity to that point.
- The gravitational potential energy is product of mass of body and gravitational potential at that point. $Potential\ Energy = m \left(-\frac{GM}{r} \right)$
- Gravitational Potential Energy depends upon
 - 1) Mass of heavy body M
 - 2) Distance between two masses r
- At infinity it is maximum and zero. At all other points it is negative

CONSERVATION LAWS:

- Familiar conservation laws: Energy, linear momentum, Angular momentum, charge etc
- Advantages:

 - 1) Understanding symmetry in the universe
 - 2) Powerful tool for solving problems
 - 3) Not depends on details of trajectory and forces involved.
 - 4) Enables the consequences of equation of motion
 - 5) Involved in Physics of elementary particles
 - 6) predicted new elementary particles
 - 7) tackling in new and not understood problems
 - 8) Prediction of certainty that particular phenomena will not occurs

WORK:

Consider particle p moving along a curve AB under the action of variable force F .

r - position vector of particle

F displaces the particle through distance dr

Infinitesimal small amount of work done dW is

$$dW = F \cdot dr$$

If particle moved from point A with position vector r_1

to point B when position vector r_2

Total work done by force on particle

$$W = \int_A^B F \cdot dr = \int_{r_1}^{r_2} F \cdot dr \quad (1)$$

F makes angle θ with tangent to the path at any point

$$W = \int_A^B F \cos\theta \, dr \quad (2)$$

Cont....

- F and θ may changes from point to point
- The integral form of equation along path AB (line integral)
- $\int_A^B F \cdot dr = \int_A^B F \cos \theta dr$ $\cos\theta$ is components of force along path
- **Work done:** Line integral of tangential components of force and taken over actual line of motion.
- If F remains constant and displacement r is along straight line then
- $W = \int_A^B f \cdot dr = F \cdot r = F \cos\theta r$ (3)
- Work: Product of components of force along the displacement and distance moved by the particle
- If F_x, F_y and F_z are rectangular components of F and $dr = dx \vec{i} + dy \vec{j} + dz \vec{k}$
 $W = \int_A^B (F_x \vec{i} + F_y \vec{j} + F_z \vec{k}) \cdot (dx \vec{i} + dy \vec{j} + dz \vec{k})$
- $W = \int_A^B (F_x dx + F_y dy + F_z dz)$ (4)

Cont.....

- If number of forces F_1, F_2 and F_3 are acting on particle so that resultant force on particle is $F = F_1 + F_2 + F_3$
 - Work done on particle
-
- $W = \int_A^B F \cdot dr = \int_A^B (F_1 + F_2 + F_3 + \dots) dr$
 - $W = \int_A^B F_1 dr + \int_A^B F_2 dr + \dots$
 - Sum of work done by each force

POWER:

- Rate of doing work
 - $P = dW/dt$
-
- If F is instantaneous force acting on the particle then
 - Instantaneous power is
 - $$P = \frac{dW}{dt} = \frac{F \cdot dr}{dt} = F \cdot v$$
 - Average Power during time interval t is
 - $$P_{av} = \frac{W}{t}$$

KINETIC ENERGY-WORK ENERGY THEOREM:

- Statement: Work done on a particle is equal to change in its kinetic energy
- Energy is capacity of doing work
- Measured as amount of work which it can do in the position in which it is
- Energy due to motion is kinetic energy

-
- According to Newtons second law of motion $F=ma$

- $F = m \cdot \frac{dv}{dt}$ where $\frac{dv}{dt}$ is acceleration produced in particle

- Amount of work done on a particle when moves from A point to B

- $$W = \int_A^B F \cdot dr = m \int_A^B \frac{dv}{dt} \cdot dr \quad (1)$$

- Now $dr = \frac{dr}{dt} \cdot dt = v \cdot dt$

- $$\frac{dv}{dt} \cdot dr = \left(\frac{dv}{dt} \cdot v \right) dt = \frac{d}{dt} \left(\frac{1}{2} v \cdot v \right) dt = d \left(\frac{v^2}{2} \right)$$

- $$\therefore W = \frac{m}{2} \int_A^B d(v^2) = \frac{m}{2} [v_B^2 - v_A^2]$$

-

Cont.....

- Where v_A and v_B speeds of particle at A and B
 - $W = \int_A^B F \cdot dr = \frac{1}{2}mv_B^2 - \frac{1}{2}mv_A^2 = \text{Change in kinetic energy}$
-

Thus Work done on particle only depends on initial and final speed of particle and independent upon nature of force and path followed by particle.

CONSERVATION OF ENERGY FOR A PARTICLE : ENERGY FUNCTION:

- Work done by a force on a particle of mass m will
- $W = \int_1^2 F \cdot dr = \frac{1}{2}mv_2^2 - \frac{1}{2}mv_1^2 = U_1 - U_2 = \text{change in kinetic energy}$
- Equation expresses that in a conservative force field if KE of particle increases in moving from one point to another then, its potential energy decreases
- $\frac{1}{2}mv_1^2 + U_1 = \frac{1}{2}mv_2^2 + U_2$
- $K_1 + U_1 = K_2 + U_2$
- **Law of conservation of energy**
- Sum of KE and PE of particle remains constant at any point of conservative force field
- The quantity $E = K + U$ Called **ENERGY FUNCTION**

MOTION OF BODY NEAR THE SURFACE OF THE EARTH:

- Body of mass m situated at height h in rest above surface
- PE is 0 at surface
- Let the x direction be normal to the surface and directed upward
- If body start to fall at any instant at height x above surface,
- The work done by gravitational force $-mg$ on body
- $W = \int_h^x (-mg)dx = -mg(x - h) = mg(h - x)$
- Work done will increases body's K.E.
- $W = \frac{1}{2}mv^2 \quad \therefore \text{Initial velocity} = 0$
- $\therefore \frac{1}{2}mv^2 = mg(h - x)$
- $\therefore mgh = \frac{1}{2}mv^2 + mgx$
- P.E. at x is mgx ,

Cont...

- **TE at Height “h” above surface**
- Initially body has only PE and no KE
- Initial TE=KE+PE=0+mgh= **mgh**
- **TE at Surface (x=0)**

- PE at surface =0, KE at surface= $\frac{1}{2}mv^2$
- TE at surface $\frac{1}{2}mv^2 =mgh$
- **TE at any Height “x”**
- PE at height “x”=mgx and KE at height “x” = $\frac{1}{2}mv^2$
- TE at any height “x”= $mgh = \frac{1}{2}mv^2 + mgx=mgh$
- **∴ TE of freely falling body remains constant through out its motion**

NON-CONSERVATIVE FORCE:

- **Non-conservative force** : Work done by force, which moves particle between two points depends upon path between those points.
- Frictional and viscous forces are non conservative forces.
- For non-conservative force work done around the closed path not zero and particle loses its KE along path.

- For conservative force, $KE + PE = E = \text{Constant}$
- $\Delta KE + \Delta PE = 0 = \Delta E$
- $W_c = -\Delta PE$ Negative increase in PE
- In addition to conservative force nonconservative force due to friction
- If W_f work done by frictional and W_c by conservative forces
- $W_f + W_c = \Delta KE$ But $W_c = -\Delta PE$
- $\Delta KE + \Delta PE = W_f$
- When frictional forces acts on particle total mechanical energy is not constant
