

QUANTUM THEORY OF LIGHT

B.Sc. T. Y.

Quantum theory of light

- **1887-Heinrich Hertz**-Observed light changes the voltage at which the sparking takes place i.e. relation between light and electricity.
- **1900- Philipp Lenard**: Demonstrated the interaction between light and matter.
- Classical physics – unable to explain Photoelectric effect
 - *Photoelectric effect by classical physics*
 - *Light as em waves*
 - *Time delay*
 - *More intense light ,greater energies of electrons*
 - *-The relations between frequency and electron energy*

Quantum theory of light

- Purposed by Albert Einstein's 1905
- Realised- Energy in light wave not spread out over wave fronts but concentrated in small packet *photon*
- Each photon of frequency ν has energy $h\nu$ same as Planck

Energy was not only given to em waves in separate quanta but also carried by waves in separate quanta

**Observations of Photoelectric effect –
Einstein's hypothesis**

1). EM waves concentration in photons so no delay

2). Intensity changes, no. of photoelectrons not energy

WORK FUNCTION:

- **Threshold Frequency (ν_0):** Minimum frequency below which no photoelectric effect
- **Work function (ϕ):** Minimum energy ϕ for an electron to escape from particular metal surface is work function of metal
 - Relations between (ϕ) and (ν_0)
 - Work function $\phi = h\nu_0$
 - Greater work function-more energy needed to leave surface-higher the threshold frequency for photoelectric emission.

Photoelectric work functions:

Sr. No.	Metal	Symbol	Work function ,eV
1	Cesium	Cs	1.9
2	Potassium	K	2.2
3	Sodium	Na	2.3
4	Lithium	Li	2.5
5	Calcium	Ca	3.2
6	Silver	Ag	4.7
7	Platinum	Pt	6.4

Photoelectric effect is phenomenon of visible and Ultraviolet region

Einstein's Photoelectric Equation

- According to Einstein, the photoelectric effect in a given metal should obey the equation

- $h\nu = K E_{Max} + \phi$
- $h\nu$ is Photon energy
- $K E_{Max}$ is maximum photoelectron energy
- ϕ is work function and $\phi = h\nu_0$
- $h\nu = K E_{Max} + h\nu_0$ and
- $K E_{Max} = h\nu - h\nu_0 = h(\nu - \nu_0)$

- Photon energy in terms of electronvolts is

- $E = \left(\frac{6.626 \times 10^{-34} \text{ J.s}}{1.602 \times 10^{-19} \text{ J/eV}} \right) \nu = (4.136 \times 10^{-15}) \nu \text{ eV.s}$

- In terms of wavelength

- $E = \left(\frac{(4.136 \times 10^{-15} \text{ eV.s})(3 \times 10^8 \text{ m/s})}{\lambda} \right) = (1.24 \times 10^{-6}) \text{ eV.m}$

$$E_{\text{photon}} = h\nu$$

700 nm
1.77 eV

no
electrons

550 nm
2.25 eV

$v_{\text{max}} = 2.96 \times 10^5 \text{ m/s}$

400 nm
3.1 eV

$v_{\text{max}} = 6.22 \times 10^5 \text{ m/s}$

Potassium - 2.0 eV needed to eject electron

Photoelectric effect
